

**Amendments to the Specification:**

Please replace the paragraph beginning at page 31, line 11, with the following amended paragraph:

For this embodiment, a unit of content of the particular channel may be provided by the dynamic container if an associated location of the particular channel corresponds to the current location ~~time~~ of the device. The associated location may correspond to a location of a source associated with the particular channel, such as a European broadcast station for the European evening news. The location of the source may be provided to the device via channel settings received from the media gateway 102 by the device's server 304. Knowing the location of the source, if a user travels with the device to a European location, then the device may select a European channel for a particular container. Thereafter, the transceiver 202 may obtain the media content, e.g., the European evening news, as soon as possible so that the information will be ready for viewing by the user with minimal delay.
